

Let's discover what's possible together.

Memory loss can happen to anyone, including ourselves or the people we love.

But it may be possible to get ahead of memory loss, and participating in clinical research may help us get there.

Could you or a loved one be a fit for a memory loss clinical research study?

Participants must:

- Be aged [65 to 80] years old
- Have no to mild issues with their memory
- Be willing to obtain a blood test as part of the study that checks whether they have an abnormal protein associated with Alzheimer's disease
- Have a reliable study partner*

** A study partner is a person who knows the participant well and would notice any changes in their memory, mood, or behavior. This could be a spouse, partner, friend, family member, or someone whose job it is to help the participant. The study partner would also need to consent to participate in the research study.*

All study-related care will be provided at no cost.
